T. DOTHAN and B. BRANDL: Deir el-Balah: Excavations in 1977-1982 in the Cemetery and Settlement. Vol. 1: Stratigraphy and Architecture

This volume and the companion volume Qedem 50 comprise the final report of the excavations carried out at Deir el-Balah in the Gaza Strip. The excavations in the cemetery continued those carried out in 1972-3, which uncovered three anthropoid coffins and rich burial offerings; the later excavations uncovered a further anthropoid coffin and numerous simple burials. The excavations in the settlement uncovered remains of a large Egyptian-type administrative residence of the Amarna period, an Egyptian-type military fortress of the period of Seti I constructed on the remains of the residence, and a large industrial complex of the 13th century BCE, followed by later strata lacking architectural remains. Vol. I contains a description of the excavation of the cemetery and its finds, a stratigraphic presentation of the remains of the settlement site, a discussion of the Egyptian character of the architecture at the site, and chapters on the kilns area in the settlement and the geological background of the site.
