ALON DE GROOT AND HANNAH BERNICK-GREENBERG: Excavations at the City of David 1978-1985 Directed by Yigal Shiloh, Volume VIIA: Area E: Stratigraphy and Architecture

Area E is the largest of the City of David's excavation areas, situated in the middle of the steep eastern slope of the ridge. The excavations presented many stratigraphic problems arising from the building of structures on a slope and the erosion of the area. Despite this, the excavations revealed an impressive sequence of architectural remains: a terrace system and cist grave cemetery of the Hellenistic period, restricted but significant finds of the Persian period, limited remains of Iron Age IIA and extensive Iron Age IIB structures adjacent to the Iron Age city wall, important remains of the Middle Bronze Age including a massive city wall, and well-preserved dwellings of the Early Bronze Age (the earliest architectural remains so far published from Jerusalem). The text volume with photographs and figures is accompanied by a separate volume containing folded plans and sections.

256 pages (text volume) + 80 pages (plans volume); Price \$72.00.
